```
The present sequence encodes winter rye (Secale cereale L. cv. Muskateer) CHT46 preprotein (see AAW98081). Mature CHT46 (see AAW98081) is a chitinase-like protein that has chitinase (antifungal) and antifreeze activities. CHT46 cDNA (ch-46) was obtained by isolating pathogens or other stresses, i.e. under conditions when only chitinases with antifreeze activity would be expressed, and then sorting the cold-induced chitinase CDNAs to determine which encoded proteins with ice-binding ability. CHT46 and CHT9 (see AAW98079-80) have been cloned and expressed in bacterial and yeast (Pichia) systems and in Arabidopsis thaliana. The chitinase-like antifreeze
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              proteins can be used: to increase freezing tolerance of plants and microorganisms; to increase field survival of plants, animals and microorganisms exposed to sub-zero temperatures; to inhibit ice recrystallisation in biological materials or foods; for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        diseases or spoilage caused by low temperature pathogens (particularly fungi) in plants, frozen foods and any cryopreserved
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cryopreservation and hypothermic protection of calls, embrycs, tissues etc. (particularly human platelets); and to kill tumour cells. They are also used to inhibit initiation and progression

The present sequence encodes a chitinase polypeptide. The specification describes glucosyl hydrolase family 19 chitinases (AAB18894, AAB18896, AAB18895, and AAB18902-05), and glucosyl hydrolase family 18 chitinases (AAB18895, AAB18897-98 and AAB18900-01). The level of chitinase in plants can be modulated to enhance disease resistance in crop plants and for control of pathogens. The chitinase polynucleotides are also useful as molecular markers for genotype in a plant, and for sequence shuffling. maize chitinase genes encoding seven chitinases of glucosyl colase family 19 are useful for enhancing disease resistance in crop 18; 620 692 752 681 cacacgctactgcggcatgcttggcacggccaccggggggcaacctcgactgctacaccca 740 cccggacctggtgtccacggacgcggtggtttccttcaggacggccatgtggttctggat 500 Chitinase; glucosyl hydrolase family 19; glucosyl hydrolase famiy pathogen control; disease resistance; molecular marker; ss. gotgecgataaegetgegggtegggteeetgggtaeggegtaateaecaatateateaa ggeegacacegetgeeggeagggtaceeggatacggagtgattaceaatateateaa cacgogetactgcgggcatgctcgggcacgggggggggggggaacctcgactgctacaccga cggcgggctcgagtgcggaatgggccggaacgacgccaacgtcgaccgcatcggctacta cDNA encoding a maize chitinase polypeptide designated 2mCh15 hydrolase family 19 are useful for enhancing d plants by modulating its expression in plants /product= "chitinase" Location/Qualifiers Claim 1; Page 84-85; 96pp; English. The present sequence encodes a chitinase polypeptide. The specification describes glucosyl hydrolase family 19 chitinases (AAB18894, AAB18896, AAB18895, AAB18897-98 and AAB1800-01). The level of Chitinases (AAB18895, AAB18897-98 and AAB1800-01). The level of Chitinase plants can be modulated to enhance disease resistance in crop plants and for control of pathogens. The chitinase polynucleotides are also useful as molecular markers for genotype in a plant, and for sequence
                                                                                                                                                                                                                                                                                                                                                                                                             crop
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         gacggggacccattcaattgacagggcggtccaactacgatcttgccgggagagcgatcg 433

```

```
The sequence given represents the rice chitinase gene. The promoter region of this gene (see AAQ31407) is responsive to physical and/or biological stress. The pattern of expression of this gene in mature plants is characteristic. There is a low level of expression in leaves, a moderate level in plant stems and the highest level in roots and the male and female parts of the plant. The chitinase promoter sequence may be linked to a reporter gene for expression in mono- or dicotyledon plants. Expression of this reporter gene may be used to study patterns of development and controlled expression of plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 612
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    672

```
The present sequence encodes winter rye (Secale cereale L. cv. Muskateer) CHT9 preprotein (see AAM98079). Mature CHT9 (see AAM98080) is a chitinase-like protein that has chitinase (antifungal) and antifreeze activities. CHT9 cDNA (ch-9) was obtained by isolating mRNA from rye plants grown at low temperatures in the absence of pathogens or other stresses, i.e. under conditions when only chitinases with antifreeze activity would be expressed, and then sorthing the cold-induced chitinase cDNAs to determine which encoded proteins with ice-binding ability. CHT9 and CHT46 (see AAM98081-82) have been cloned and expressed in bacterial and yeast (Pichia) systems and in Arabidopsis thallana. The chitinase-like antifreeze proteins can be used: to increase freezing tolerance of plants and microorganisms; to increase field survival of plants, animals and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        microorganisms exposed to sub-zero temperatures; to inhibit ice recrystallisation in biological materials or foods; for cryopreservation and hypothermic protection of cells, embryos, tissues etc. (particularly human platelets); and to kill tumour cells. They are also used to inhibit initiation and progression of diseases or spoilage caused by low temperature pathogens (particularly fungi) in plants, frozen foods and any cryopreserved
                                                New nucleic acid encoding antifreeze polypeptides from plants particularly with chitinase activity, used to impart frost, and pathogen, resistant to plants, for preservation of foods, cells
                                                                                                                                                                                    Claim 2; Fig 21a; 118pp; English.

The present sequence encodes a chitinase designated RCH10. The specification describes chimeric receptors which are used for modulating plant responses to pathogens. The receptors comprise a heterologous extracellular domain (e.g. from a Bril protein or RCH10 protein) and a kinase domain (e.g. from disease resistance protein Xa21). The Xa21 gene is a member of disease resistance genes referred to as RKK genes. When Xa21 is present in a transgenic plant, it confers resistance to Xanthomoras spp. The plant receptors containing heterologous domains are useful for modulating plant responses to pathogens including viruses, bacteria, nematodes, fungi or insects. The nucleic acids can be used to confer desired traits on essentially any plant.
                                                                                                                                                                                                                                                                                                                                                                                                          Disease resistance protein; Xa21; RKK gene; transgenic plant; chitinase; Xanthomonas; plant pathogen; Bril protein; RCH10 protein; ss.

This sequence encodes Chitinase G. Chitinase is an enzyme which breaks down chitin, the major protein in insect exoskeletons. The coding sequence may be used in the construction of transgenic organisms, especially plants, to produce pathogen resistant organisms. The genome of such transgenic organisms preferably contains more then one gene with pathogen inhibiting activity, each gene under the control of active promoters. The two gene products then show a synergistic increase in pathogen induced activity so that the transgenic organisms have a greater degree of resistance or resistance or adder spectrum of diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    geagegigicetecategictegegegeacagitigacegeatgeitetecacegeaaeg 190

                                                                                                                                   This cDNA encodes a floral organ-specific chitinase. The specification provides a promoter sequence (AAV49083) derived from rice associated with chitinase, specific to floral organs that allows expression of genes in the flower parts of monocotyledonous plants. The expression of desired genes specifically in the floral parts of monocotyledonous plants, allows modifications to be made in the structure or function of these parts allowing the introduction of desired characteristics such as increased resistance to bacterial attack.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ---gecggcggcaacggcggcggccgaccgggtcgcgttctacaagcgctactgcgacgtg 1013

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence encodes a chitinase polypeptide. The specification describes glucosyl hydrolase family 19 chitinases (AAB18894, AAB18896, AAB18895, and AAB18902-05), and glucosyl hydrolase famiy 18 chitinases (AAB18895, AAB18897-98 and AAB18900-01). The level of chitinase in plants can be modulated to enhance disease resistance in crop plants and for control of pathogens. The chitinase polynucleotides are also useful as molecular markers for genotype in a plant, and for sequence shuffling.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New maize chitinase genes encoding seven chitinases of glucosyl hydrolase family 19 are useful for enhancing disease resistance in crop plants by modulating its expression in plants

                                                This chimeric DNA sequence comprises the PR-Q plant pathogenesis-
related protein (PRP)-coding sequence,(1), and a promoter sequence
which enhances transcription of (1). This construct is used to
produce transgenic plant cells or -tissues with the ability to re-
generate into plants which are disease resistant.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  \OmegaY
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence represents a clone of the tobacco pathogenesis related (PR)

gene. This gene can be isolated using the method of the invention.

The method is for isolating a chemically regulatable DNA promoter

fragment from the 5' flanking region of a chemically regulatable gene in

fragment from the controlled expression of genes, under the control of a

consecul for the controlled expression of genes, under the control of a

con-coding regulatable sequence. This is useful in plants with a

connecoding regulatable sequence. This is useful in plants with a

connecoding regulatable sequence. This is useful in plants with the

conformator. The regulatator being applied before or with the

cherbicide or pesticide to give optimal tolerance. The promoter fragment

conformation for development, make or female sterility, and the ability

cof the plant to withstand cold, heat, salt and drought. The chemical

induction of the promoter allows the regulation of production of

compounds, es, flavours, fragrances, pigments, natural sweeteners,

industrial feedstocks, antimicrobials and pharmaceuticals, by

compounds, es, flavours, fragrances, pigments, or industrial feedstocks, antimicrobials and pharmaceuticals, by

confounds, es, controlling sens. The method allows control over the time

conditions or foreign genes. The method allows control over the time

and rate of gene expression either throughout the whole plant, or in

conditions the leaves with the chemical regulator. Controlling the

controlling the leaves with the chemical regulator.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes a DNA molecule encoding a pathogenesis-related (PR) protein having beta-1,3-glucanase activity selected from PR-2, PR-2', PR-N', PR-N PR-0 and PR-0'. Also described are: (i) a chimeric gene comprising the above DNA molecule linked to a heterologous promoter; (ii) a vector containing the chimeric gene; (iii) a beta containing the chimeric gene; (iii) a beta containing the chimeric gene; (iv) a transgenic plant. The DNA molecule is used to produce transgenic plants and containing the chimeric gene; and (v) a seed from the transgenic plant. The DNA molecule is used to produce transgenic plants with enhanced disease or pest resistance. The present sequence represents a tobacco PR-Q protein encoding cDNA sequence from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          251

                                                                                                                                                                                                                         Gaps
                                  This sequence was isolated from a P.hybrida cDNA library. It has 80 per cent homology with tobacco clone PROB30 which encodes extracellular chitinase PR-Protein R. The gene can be inserted into an appropriate plasmid for production of transgenic plants having resistance to fungal pathogens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             447 tgaacaagacttagttaacaaccctgatttagtagcaacagatgctactgtatcattcaa
